DETAILED ACTION

Schneider et al teaches a collapsible container with a durable bottom shell which is structurally similar to the Applicant's claimed container having a top wall, bottom wall and sidewall. The sidewall is flexible extendible between a collapsed state and an erected state. A spring is supported by a spring disposed therein. The container is used to store a variety of materials. However, Schneider et al do not specifically discuss storing animal feed within the distended container. Regarding claim 1, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to place a material, such as animal food into the container of Schneider et al in order to preserve the food between feedings. Regarding claims 2 and 3, the container of Schneider et al can be collapsed by pressing down on the sidewall against the spring. In regards to claims 4 and 8, the container is maintain in the collapsed state by elements 64 and 66. Regarding claim 5, to provide a plurality of containers is considered to be obvious to a person of ordinary skill in the art at the time the invention was made in order to store a variety of materials separate from one another.

Conclusion

Summary: Claims 1-8 are rejected.
